**SEASONAL FORECAST OUTLOOK BULLETIN  
for WMO NORTH AFRICA RCC domain  
Season: NOVEMBER-DECEMBER-JANUARY 2014/2015  
Issued: October 2014**

Seasonal forecast outlook for North Africa RCC domain is based on the ARPEGE-Climat coupled model output jointly with seasonal forecasts issued from ECMWF, UK Met-Office and IRI. The ARPEGE-Climat coupled model is running at MAROC-METEO super-computer each month to elaborate seasonal ensemble forecasts. Sets of 27 forecasts are initialized by 9 atmospheric analysis, taken from ECMWF database, and 3 ocean analysis (PSY2G3R3) issued from MERCATOR center.

We also try to exploit the sources of predictability contained in the sea surface temperature (SST) by statistical methods when it is possible. We note, however, that this influence is not the same from one region to another or throughout all the year.

**Synthesis:**

The analysis of seasonal forecasts issued from dynamical and statistical models for NDJ2014 show probably:

- For temperature:
  - ✚ Above normal conditions over north African countries
- For precipitation:
  - ✚ Normal to below normal conditions over Morocco, Algeria and Tunisia
  - ✚ No special scenario is likely over Libya and Egypt

**NB: Precipitation forecasts are given for September to May (the main rainy season). Temperature forecasts are given for January to December.**
